

# Firmware Execution Flow

Untitled Space Craft firmware is written in C/C++ and targets the Arduino platform. On power-up, the Hub initializes the hardware, discovers connected modules, and attempts to establish communication with Kerbal Simpit.

Once it is ready, it will repeatedly attempt to connect to Simpit for either KSP1 or KSP2. During this time, if 3 repeated inputs are detected, it will enter Keyboard Emulation mode. If the connection to Simpit is successful, it will enter KSP mode.
